

The image shows a Visual Studio Code editor window with a Python file named `apiintegration.py` open. The script uses the `requests` library to fetch data from a JSON placeholder API. The terminal output shows the script was executed successfully, displaying the total number of posts (100) and the first three posts with their IDs, titles, and bodies.

```
1 import requests
2
3 # Define the API endpoint
4 api_url = "https://jsonplaceholder.typicode.com/posts"
5
6 # Make a GET request to the API
7 response = requests.get(api_url)
8
9 # Check if the request was successful (status code 200)
10 if response.status_code == 200:
11     print("Successfully fetched data!")
12     # Parse the JSON response
13     posts = response.json()
14     print(f"Total posts fetched: {len(posts)}")
15     print("\nFirst 3 posts:")
16     for i, post in enumerate(posts[:3]):
17         print(f"Post {i+1}:")
18         print(f"  ID: {post['id']}")
19         print(f"  Title: {post['title'][:50]}...") # Display first 50 chars of title
20         print(f"  Body: {post['body'][:100]}...") # Display first 100 chars of body
21         print("-" * 20)
22 else:
23     print(f"Error fetching data: {response.status_code} - {response.text}")
```

Terminal Output:

```
PS C:\Users\Saurabh\OneDrive\intern task2> python -u "c:\Users\Saurabh\OneDrive\intern task2\apiintegration.py"
